Degrees of reactivity may not in all cases correlate with levels of clinical reactivity to the tested food or chemical. It is recommended to completely avoid all tested items with "Reactive" or "Moderately Reactive" scores. If tested "Non-Reactive" foods have been consumed regularly before testing, there is a high probability that they are "safe" and are not likely to provoke symptoms, as long as there is no history of allergic, autoimmune, or other type of inflammation-provoking or symptom-provoking reaction.

These test results can form the basis of an eating plan developed under the guidance of a physician, dietitian, or other qualified healthcare practitioner.
